Syn. — Administration; guidance; management; superintendence; oversight; government; order; command, guide; clew. — Direction, Control, Command, Order. These words, as here compared, have reference to the exercise of power over the actions of others. *Control* is negative, denoting power to restrain, *command* is positive, implying a right to enforce obedience, *directions* are commands containing instructions how to act. *Order* conveys more prominently the idea of authority than the word *direction.* A shipmaster has the *command* of his vessel; he gives *orders* or *directions* to the seamen as to the mode of sailing it, and exercises a due *control* over the conduct of the passengers.

BI-, DI-, DIA-. *Dis-* denotes *separation*, *a parting from*, as in *distribute*, *disconnect*, hence it often has the force of a privative and negative, as in *disarm*, *disoblige*, *disagree*. Also intensive, as in *dissever*

☞ Walker's rule of pronouncing this prefix is, that the *s* ought always to be pronounced like *z*, when the next syllable is accented and begins with "a flat mute [*b*, *d*, *v*, *g*, *z*], a liquid [*l*, *m*, *n*, *r*], or a vowel, as, *disable*, *disease*, *disorder*, *disuse*, *disband*, *disdain*, *disgrace*, *disvalue*, *disjoin*, *dislike*, *dislodge*, *dismay*, *dismember*, *dismiss*, *dismount*, *dismattered*, *disrank*, *disrelish*, *dissolve*" Dr Webster's example in disapproving of Walker's rule and pronouncing *dis-* as *diz* in only one (*disease*) of the above words, is followed by recent orthoepists See DISABLE, DISGRACE, and the other words, beginning with *dis-*, in this Dictionary.

It may mean little more than want of positive liking; but *antipathy*, *repugnance*, *disgust*, and *aversion* are more intense phases of *dislike*. *Aversion* denotes a fixed and habitual dislike; as, an *aversion* to or for business. *Reluctance* and *repugnance* denote a mental strife or hostility against something proposed (*repugnance* being the stronger), as, a *reluctance* to make the necessary sacrifices, and a *repugnance* to the submissions required. *Disgust* is repugnance either of taste or moral feeling; as, a *disgust* at gross exhibitions of selfishness. *Antipathy* is primarily an instinctive feeling of dislike of a thing, such as most persons feel for a snake. A period of from four to six weeks, in the summer, variously placed by almanac makers between the early part of July and the early part of September, canicular days, — so called in reference to the rising in ancient times of the Dog Star (Sirius) with the sun. Popularly, the sultry, close part of the summer.

☞ The conjunction of the rising of the Dog Star with the rising of the sun was regarded by the ancients as one of the causes of the sultry heat of summer, and of the maladies which then prevailed. But as the conjunction does not occur at the same time in all latitudes, and is not constant in the same region for a long period, there has been much variation in calendars regarding the limits of the dog days.

The astronomer Roger Long states that in an ancient calendar in Bede (died 735) the beginning of *dog days* is placed on the 14th of July, that in a calendar prefixed to the Common Prayer, printed in the time of Queen Elizabeth, they were said to begin on the 6th of July and end on the 5th of September, that, from the Restoration (1660) to the beginning of New Style (1752), British almanacs placed the beginning on the 19th of July and the end on the 28th of August; and that after 1752 the beginning was put on the 30th of July, the end on the 7th of September.

Some English calendars now put the beginning on July 3d, and the ending on August 11th. A popular American almanac of the present time (1890) places the beginning on the 25th of July, and the end on the 5th of September

E.

E (ē). **1.** The fifth letter of the English alphabet. It derives its form, name, and value from the Latin, the form and value being further derived from the Greek, into which it came from the Phœnician, and ultimately, probably, from the Egyptian. Its etymological relations are closest with the vowels *i*, *a*, and *o*, as illustrated by to *fall*, to *fell*; *man*, pl. men, drink, drank, drench; *dint*, *dent*; *doom*, *deem*; *goose*, pl. *geese*; *beef*, OF. *boef*, L. *bos*; and E. *cheer*, OF. *chière*, LL *cara*.

The letter *e* has in English several vowel sounds, the two principal being its long or name sound, as in *eve*, *me*, and the short, as in *end*, *best*. Usually at the end of words it is silent, but serves to indicate that the preceding vowel has its long sound, where otherwise it would be short, as in *māne*, *cāne*, *mēte*, which without the final *e* would be pronounced *măn*, *căn*, *mĕt*. After *c* and *g*, the final *e* indicates that these letters are to be pronounced as *s* and *j*, respectively, as in *lace*, *rage*.

See *Guide to Pronunciation*, §§ 75–97.

Diagrammatic sectional view of the Human Ear of the left side

☞ In man and the higher vertebrates, the organ of hearing is very complicated, and is divisible into three parts: the external ear, which includes the *pinna* or *auricle* and *meatus* or external opening, the middle ear, drum, or *tympanum*, and the internal ear, or *labyrinth.* The middle ear is a cavity connected by the *Eustachian tube* with the pharynx, separated from the opening of the external ear by the *tympanic membrane*, and containing a chain of three small bones, or ossicles, named *malleus*, *incus*, and *stapes*, which connect this membrane with the internal ear. The essential part of the internal ear where the fibers of the auditory nerve terminate, is the *membranous labyrinth*, a complicated system of sacs and tubes filled with a fluid (the endolymph), and lodged in a cavity, called the *bony labyrinth*, in the periotic bone. The membranous labyrinth does not completely fill the bony labyrinth, but is partially suspended in it in a fluid (the perilymph). The bony labyrinth consists of a central cavity, the *vestibule*, into which three *semicircular canals* and the canal of the *cochlea* (spirally coiled in mammals) open. The vestibular portion of the membranous labyrinth consists of two sacs, the *utriculus* and *sacculus*, connected by a narrow tube, into the former of which three membranous semicircular canals open, while the latter is connected with a membranous tube in the cochlea containing the *organ of Corti.* By the help of the external ear the sonorous vibrations of the air are concentrated upon the tympanic membrane and set it vibrating, the chain of bones in the middle ear transmits these vibrations to the internal ear, where they cause certain delicate structures in the organ of Corti, and other parts of the membranous labyrinth, to stimulate the fibers of the auditory nerve to transmit sonorous impulses to the brain.

2. One of the ultimate, undecomposable constituents of any kind of matter. Specifically: (*Chem.*) A substance which cannot be decomposed into different kinds of matter by any means at present employed; as, the *elements* of water are oxygen and hydrogen.

☞ The elements are naturally classified in several families or groups, as the group of the *alkaline* elements, the *halogen* group, and the like. They are roughly divided into two great classes, the *metals*, as sodium, calcium, etc., which form basic compounds, and the *nonmetals* or *metalloids*, as oxygen, sulphur, chlorine, which form acid compounds, but the distinction is only relative, and some, as arsenic, tin, aluminium, etc., form both acid and basic compounds. The essential fact regarding every element is its relative *atomic weight* or *equivalent*. When the elements are tabulated in the order of their ascending atomic weights, the arrangement constitutes the series of the *Periodic law* of Mendelejeff. See *Periodic law*, under PERIODIC. This Periodic law enables us to predict the qualities of unknown elements The number of elements known is about seventy-five, but the gaps in the Periodic law indicate the possibility of many more. Many of the elements with which we are familiar, as hydrogen, carbon, iron, gold, etc., have been recognized, by means of spectrum analysis, in the sun and the fixed stars. From certain evidence (as that afforded by the Periodic law, spectrum analysis, etc) it appears that the chemical elements probably may not be simple bodies, but only very stable compounds of some simpler body or bodies In formulas, the elements are designated by abbreviations of their names in Latin or New Latin.

3. (*Law*) A system of jurisprudence, supplemental to law, properly so called, and complemental of it

Equity had been gradually shaping itself into a refined science which no human faculties could master without long and intense application *Macaulay*

☞ Equitable jurisprudence in England and in the United States grew up from the inadequacy of common-law forms to secure justice in all cases; and this led to distinct courts by which equity was applied in the way of injunctions, bills of discovery, bills for specified performance, and other processes by which the merits of a case could be reached more summarily or more effectively than by common-law suits By the recent English Judicature Act (1873), however, the English judges are bound to give effect, in common-law suits, to all equitable rights and remedies, and when the rules of equity and of common law, in any particular case, conflict, the rules of equity are to prevail In many jurisdictions in the United States, equity and common law are thus blended, in others distinct equity tribunals are still maintained. See CHANCERY.

2. (*Chem.*) That comparative quantity by weight of an element which possesses the same chemical value as other elements, as determined by actual experiment and reference to the same standard. Specifically: (*a*) The comparative proportions by which one element replaces another in any particular compound; thus, as zinc replaces hydrogen in hydrochloric acid, their *equivalents* are 32.5 and 1. (*b*) The combining proportion by weight of a substance, or the number expressing this proportion, in any particular compound; as, the *equivalents* of hydrogen and oxygen in water are respectively 1 and 8, and in hydric dioxide 1 and 16.

☞ This term was adopted by Wollaston to avoid using the conjectural expression *atomic weight*, with which, however, for a time it was practically synonymous. The attempt to limit the term to the meaning of a universally comparative combining weight failed, because of the possibility of several compounds of the same substances by reason of the variation in combining power which most elements exhibit. The *equivalent* was really identical with, or a multiple or submultiple of, the atomic weight.

3. (*Chem*) A combining unit, whether an atom, a radical, or a molecule; as, in an acid salt two or more *equivalents* of acid unite with one or more *equivalents* of base.

Mechanical equivalent of heat (*Physics*), the number of units of work which the unit of heat can perform; the mechanical energy which must be expended to raise the temperature of a unit weight of water from 0° C. to 1° C., or from 32° F to 33° F. The term was introduced by Dr. Mayer of Heilbronn Its value was found by Joule to be 1390 foot pounds upon the Centigrade, or 772 foot pounds upon the Fahrenheit, thermometric scale, whence it is often called *Joule's equivalent*, and represented by the symbol J. This is equal to 424 kilogram meters (Centigrade scale) A more recent determination by Professor Rowland gives the value 426.9 kilogram meters, for the latitude of Baltimore.

Syn.—Ambiguous; doubtful; uncertain; indeterminate.—Equivocal, Ambiguous We call an expression *ambiguous* when it has one general meaning, and yet contains certain words which may be taken in two different senses; or certain clauses which can be so connected with other clauses as to divide the mind between different views of part of the meaning intended We call an expression *equivocal* when, taken as a whole, it conveys a given thought with perfect clearness and propriety, and also another thought with equal propriety and clearness. Such were the responses often given by the Delphic oracle; as that to Cræsus when consulting about a war with Persia. "If you cross the Halys, you will destroy a great empire" This he applied to the Persian empire, which lay beyond that river, and, having crossed, destroyed his own empire in the conflict. What is *ambiguous* is a mere blunder of language, what is *equivocal* is usually intended to deceive, though it may occur at times from mere inadvertence. *Equivocation* is applied only to cases where there is a design to deceive.

Syn. — Incident; occurrence; adventure; issue; result; termination; consequence; conclusion. — EVENT, OCCURRENCE, INCIDENT, CIRCUMSTANCE. An *event* denotes that which arises from a preceding state of things.

Hence we speak of watching the *event*; of tracing the progress of *events*. An *occurrence* has no reference to any antecedents, but simply marks that which *meets* us in our progress through life, as if by chance, or in the course of divine providence. The things which thus meet us, if important, are usually connected with antecedents; and hence *event* is the leading term. In the "Declaration of Independence" it is said, "When, in the course of human *events*, it becomes necessary," etc. Here, *occurrences* would be out of place. An *incident* is that which *falls into* a state of things to which it does not primarily belong, as, the *incidents* of a journey. The term is usually applied to things of secondary importance. A *circumstance* is one of the things surrounding us in our path of life. These may differ greatly in importance; but they are always *outsiders*, which operate upon us from without, exerting greater or less influence according to their intrinsic importance. The process is by some limited to organic beings, by others it is applied to the inorganic and the psychical. It is also applied to explain the existence and growth of institutions, manners, language, civilization, and every product of human activity The agencies and laws of the process are variously explained by different philosophers.

Syn. — Precedent; case; instance — EXAMPLE, INSTANCE. The discrimination to be made between these two words relates to cases in which we give "instances" or "examples" of things done An *instance* denotes the single case then "standing" before us, if there be others like it, the word does not express this fact. On the contrary, an *example* is one of an entire class of like things, and should be a true representative or *sample* of that class Hence, an *example* proves a rule or regular course of things, an *instance* simply points out what may be true only in the case presented A man's life may be filled up with *examples* of the self-command and kindness which marked his character, and may present only a solitary *instance* of haste or severity. Hence, the word "example" should never be used to describe what stands singly and alone. We do, however, sometimes apply the word *instance* to what is really an *example*, because we are not thinking of the latter under this aspect, but solely as a case which "stands before us" See PRECEDENT

☞ The *exchequer* was a court of law and equity. In the revenue department, it had jurisdiction over the proprietary rights of the crown against subjects; in the common law department, it administered justice in personal actions between subject and subject. A person proceeding against another in the revenue department was said to *exchequer* him. The judges of this court were one chief and four puisne barons, so styled. The *Court of Exchequer Chamber* sat as a court of error in which the judgments of each of the superior courts of common law, in England, were subject to revision by the judges of the other two sitting collectively. Causes involving difficult questions of law were sometimes, after argument, adjourned into this court from the other courts, for debate before judgment in the court below. Recent legislation in England (1880) has abolished the Court of Exchequer and the Court of Exchequer Chamber, as distinct tribunals, a single board of judicature, the High Court of Justice, being established for the trial of all classes of civil cases. *Wharton.*
